Thank you for getting in touch with us. It isn't straightforward for us to give a rough comparison of difficulty level for the questions that you have listed, as they are formatted quite differently than how we would approach exam questions. Notably Q2 and Q3 are described as multiple choice questions, which is not an assessment format that we use in GCSE (9-1) Mathematics. However, I can try to give an approximation of difficulty with regards to where the question topic falls in our specification. Here is a link to the specification for J560 which I will refer to in my responses.

1. This questions comes under the content reference 5.03a and 2.03c. Both of these come under the 'Foundation learners' column. However, the combination of reverse percentage with repeated percentage change does increase the question demand. Here is an example of a similar question we have asked in the past, from J560/05 2017. This was around the middle of a Higher tier paper.

12 Helen delivers parcels.
On Tuesday, Helen delivered 20% more parcels than on Monday.
On Wednesday, Helen delivered 50% fewer parcels than on Tuesday.
On Wednesday, Helen delivered 72 parcels.

Calculate the number of parcels that Helen delivered on Monday.
